# **CHAPTER 1 OPERATION**

CRT display

# 1-1. FEATURES

# Possible to connect any monitor TV

The HB-579/759/758 has an RF connector and a 6-pin DIN-type VIDEO/AUDIO connector for video/audio output. In addition to this, the HB-759/758 has an analog RGB connector, so that any type of monitor TV can be connected to the computer.

# Various graphic patterns and characters input

Combinations of normal alphanumeric keys and control keys allow you to easily input up to 252 kinds of characters, symbols and graphic patterns from the keyboard.

## Built-in MSX-BASIC

The built-in MSX-BASIC has 119 commands which allow you easy pro-gram development. With the MSX-BASIC sprite function, you can make grain development. With the MSA-BASIC sprite function, you can make and move the different patterns on each of the 32 sprite planes. The sound generator makes it possible to output three tones and one noise simultaneously, so that you can generate various effect sound or music by using the PLAY and SOUND command of the MSX-BASIC. Two supplied manuals for the MSX-BASIC will tell you not only how to use the MSX-BASIC but also the pleasure of programming.

Easy-to-use Personal Data Bank The Personal Data Bank, which is the other built-in software, makes it easy to handle personal data such as addresses, phone numbers, and so on. Convenient to use, you are sure to find many uses for it.

# Various peripherals for the HB-55P/75P/75B

Various peripherals for the HB-SbP//SP//SB Various peripherals can be connected: MSX-BASIC program and data and the Personal Data Bank data can be saved on an audio cassette tape, a data cartridge, or a micro fioppydisk. To print out data or graphics, the color plotter printer is useful. When playing a computer game, you can use up to two joystick controllers to make the game more exciting.

# Peripheral devices for HB-55P/75P/75B

Device name	Major features
HBD-50 Micro Floppydisk Drive	High-density information storage     Easy-to-operate     Fast recall of data
JS-55 Joystick	<ul> <li>Designed for left- or right handed players</li> <li>Shoot buttons on both left and right</li> </ul>
JS-75 Wireless Joystick	<ul> <li>No cords to get tangled</li> <li>Can be operated from up to 7 meters away</li> </ul>
TCM-3000D Datacorder	<ul> <li>Easy to operate with any computer</li> <li>High-speed data transfer</li> </ul>
PRN-C41 Color Plotter Printer	<ul> <li>Four-color printer: black, blue, green and red</li> <li>Light weight and compact</li> <li>Can use any paper up to 114mm in width</li> </ul>

# **1-3. LOCATION AND FUNCTION OF PARTS** AND CONTROLS

Rea

(This photo is the HB-75P.)

POWER switch and indicator Press the switch to turn on the computer. To turn off, press the switch again. The indicator lights up while the power is on.

Cartridge slot A Accepts a ROM cartridge or a RAM cartridge here.

PRESET button Press this button if there is a program overrun to reset the computer to the initial state. When the button is pressed, the built-in memory contents will be destroyed.

• CONTROLLER A and B connectors Accepts joystick controllers. When using only one joystick controller, connect it to the CONTROLLER A connector.

- 6 Keyboard Is used to input the program and the data into the computer.
- **O** RF (RF output) connector When using a normal TV receiver, connect this connector to the TV antenna terminal with a 75-ohm coaxial cable.
- VIDEO/AUDIO (video/audio output) connector (6-pin DIN connector) Connect to the monitor TV with a 6-pin DIN connector. This connector outputs both the video and the audio signals.

Cartridge slot B This slot can be used to insert a ROM cartridge or a RAM cartridge (an expansion memory cartridge, a game cartridge and so on) as the secondary slot. This slot is the same as cartridge slot A. Before using this slot, the receptacle should be installed.

O PRINTER connector (14-pin connector) Connect an 8-bit parallel transfer printer with MSX specifications such as the Sony PRN-C41 color plotter printer.

① TAPE connector (8-pin DIN connector) Connect to a tape recorder to save a program or data on a cassette tape or to load them into the computer from a tape.

① RGB (RGB output) connector (21-pin connector) The HB-55P is not equipped with this connector. Connect to the monitor TV having an analog RGB input connector.

# HB-55P/75P/75B(AE/UK)

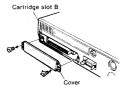

# **1-4. CONNECTION**

Make sure to turn off the computer and all the devices to be connected.

# INSTALLING THE RECEPTACLE FOR CARTRIDGE SLOT B

When cartridge slot B is to be used, install the receptacle supplied.

1. Loosen the two screws, and remove the slot cover.

2. Fix the receptacle with screws

# CONNECTING A MONITOR TV

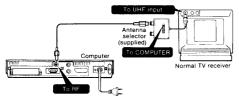

# Connecting a normal TV receiver

1. Connect the TV antenna terminal to the supplied antenna selector.

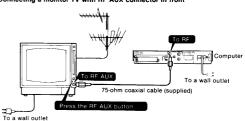

Antenna selector (supplied)

2. Connect a TV receiver to the computer

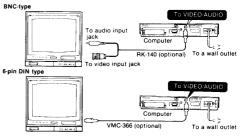

- Notes
  Set the switch of the antenna selector to the COMPUTER position when using the computer; To watch TV, set it to the AERIAL position.
  Select the channel UHF 36 for the computer.

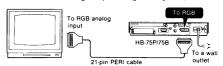

Connecting a monitor TV with RF AUX connector in front

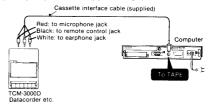

If your monitor TV has an composite video signal input (BNC-type or 6-pin DIN type)

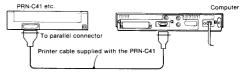

Connecting a color monitor Connect a color monitor having a 21-pin analog RGB signal input.

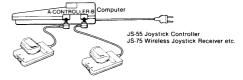

# CONNECTING A TAPE RECORDER AS AN EXTERNAL MEMORY

# CONNECTING A PRINTER

# CONNECTING A JOYSTICK CONTROLLER

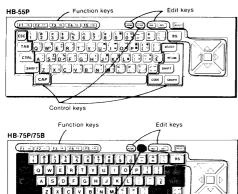

HB-55P/75P/75B(AE/UK)

# 1-5. KEYBOARD OPERATION

# **KEY ARRANGEMENT**

Alphanumeric characters are arranged in the standard QWERTY type writer keyboard, as shown below

Control

In the HB-55P, the graphic patterns are printed on the keyboard, while in the HB-75P/75B, graphic pattern decal can be affixed to the keyboard.

The supplied graphic pattern sheet is as follows:

To enter these patterns or characters.

The keyboard has character input, control, edit and function keys. When a character input key is pressed, the corresponding character is entered into the computer. When a control key is pressed, the corresponding Into the computer, when a control not in proceed, the computer value performed. Character input keys: A to Z, 0 to 9, +, ?,  $\neg$ , ", and so forth. The space bar generates a blank space. Edit keys: **HOME**, **INS**, **DEL**, **ISS** and cursor move keys (**S**)

Control keys: [SHIFT] [CAP], [CODE], [GRAPH], [CTRL], [TAB], [RETURN, [ESC], [STOP], and [SELECT]. Function keys: F1 (F6) to F5 (F10)

# CHARACTER INPUT

# To enter characters

When a character input key is pressed, the small letter or symbol printed on the lower part on the key top is entered.

Pressed key	Character or symbol to be entered		
 E J	t	(HB-55P)	
	6	(HB-75P/75B)	

When a character input key is pressed with the SHIFT key, the capital letter or symbol printed on the upper part of the key top is e ntered

(HB-55P)

(HB-75P/75B)

Pressed key		Character or symbol to be entered
SHIFT	+ [s]∄	s
SHIFT	+ (±:	+

## To enter only capital letters

Depress the ICAP, key. When this key is pressed, it will lock; when pressed again, it will unlock. While this key locks, the CAP indicator lights up, and the 26 alphabet letters are entered in caps (just as when the SHIFT) key is pressed in the normal mode), but numbers and symbols are entered in the normal mode.

Locked key	Pressed key	Character or symbol to be entered	
CAP	<u>k</u> .)	к	(HB-55P)
CAP	+	7	(HB-75P/75B)

# To put an accent mark on a character

Key  $\exists$  is used to put an accent mark on a character. To put the accent mark printed on the lower-left of the key (`) on a character, first, press key  $\underline{\Box}$  (in this step, no symbol is displayed on the screen). Then, press the character input key needing an accent mark. The

character with an accent mark is displayed. In the same way, to put the accent mark on the upper-left of the key (\*), press the key while pressing the <u>SHIFT</u> key. To put the accent mark on the lower-right of the key (c) (\*), press the key together with the <u>CODE</u> key. To put the accent mark on the upper-right of the key (c) (\*), press the key while pressing the SHIFT key and the CODE key.

To enter a character or symbol printed on the graphic pattern sheet The procedure to enter a character or symbol printed on the supplied graphic pattern sheet is as follows:

## To enter graphic patterns

To enter the graphic pattern printed on the lower-right part of the key on the graphic pattern sheet, press the corresponding keyboard character input key while pressing the **GRAPH** key.

Pressed key	Graphic pattern to be entered	
GRAPH +	÷	(HB-55P)
GRAPH + Q		(HB-75P/75B)

To enter the graphic pattern printed on the upper-right part of the key on the graphic pattern sheet, press the corresponding keyboard character input key while pressing the **GRAPH** key and the **SHIFT** key.

Pressed key	Graphic pattern to be entered	
GRAPH + SHIFT +	Л	(HB-55P)
GRAPH + SHIFT + 7	+	(HB-75P/75B)

To enter special characters

To enter the character or symbol printed on the lower-left part of the key on the graphic pattern sheet, press the corresponding keyboard char-acter input key while pressing the <u>[CODE]</u> key.

Pressed key	Character or symbol to be entered	
CODE +	.j ø	(HB-55P)
CODE + D	T T	(HB-75P/75B)

1-4

To enter the character or symbol printed on the upper-left part of the key on the graphic pattern sheet, press the corresponding keyboard character input key while pressing the CODE key and the SHIFT key.

Pressed key	Character or symbol to be entered	
CODE + SHIFT + 5	¥	(HB-55P)
CODE + SHIFT + N	Ň	(HB-75P/75B)

## Notes

 When using the CODE key, release the CAP lock state.
 In the HB-75P/75B, graphic pattern decal, which can be affixed to the keyboard, is supplied

Align the line on the decal with the end of the key. Putting your finger on the pattern, remove the upper decal.

# EDIT KEY FUNCTIONS

EDIT KEY FUNCTIONS Keys (HOME), (INS), (DEL), (BS) and cursor move keys ((K)) are mainly used for editing a line or screen. Each function is determined by the software used, so read the relevant Software Guide for details. Under MSX-BASIC, the edit keys function as follows

HOME key When this key is pressed, the cursor moves to the upper-left corner of the display screen. The characters displayed on the screen remain. When pressing this key together with the SHIFT key, the cursor moves to the upper-left corner of the screen, while any character displayed on the reen is erased

## INS (insert) key

Once this key is pressed, the computer is set to the insert mode. In this mode, the cursor becomes smaller and the character at the cursor position and the followings are moved one space to the right when a key is pressed, and you can insert as many characters as you want. When pressing this key again or moving the cursor with cursor move keys, the insert mode will be released.

[DEL] (delete) key The character at the cursor position is deleted. All characters after the deleted character are moved one space to the left.

# BS (back space) key

When this key is pressed, the cursor moves one space to the left and the character in that position is deleted.

# (cursor move) keys

These keys are used to move the cursor one space in the direction of the triangle: to the right, to the left, up or down. Any character which the cursor moves over does not change.

## CONTROL KEY FUNCTIONS

SHIFT key When this key is pressed together with a character input key, the corresponding symbol in the shift position (upper-left symbol on the key) or corresponding capital letter is entered.

## CAP key

[CAP] key When this key is pressed, it will lock so that all letters are entered in capitals. Numbers and symbols will be entered normally even if this key locks. When the key is pressed again, it will unlock. While this key is locked, the CAP indicator lights up.

CODE key When this key is pressed together with a character input key, the lowerleft character or symbol printed on the graphic pattern sheet (supplied) is

when this key is pressed together with a character input key and the [SHIFT] key, the upper-left character or symbol on the graphic pattern sheet is entered.

# HB-55P/75P/75B(AE/UK)

1-5

GRAPH key When this key is pressed together with a character input key, the lowerwhen this key is pressed together with a character input key, the totel When this key is pressed together with a character input key and the SHIFT key, the upper-right graphic pattern printed on the graphic pattern sheet is entered

In the HB-55P, graphic patterns are also printed on the keyboard.

# CTRL (control) key

When this key is pressed together with certain keys, a special operation is performed. The key function is determined by the software used. Under

- MSX-BASIC, the following key combinations are available: CTRL + B : moves the cursor to the beginning of the word at the cursor position. When the cursor is positioned at the beginning of a word, the cursor moves to the begining of the preceding word.
- CTRL + C : releases to input wait state or automatic line number
- generation. deletes the character between the cursor position and the end of the line. CTRL + E :
- CTRL + F moves the cursor to the beginning of the next word.
- CTRL + G : CTRL + H : CTRL + I : generates a beep sound. has the same function as the **BS** key.
- has the same function as the TAB key.

- CTRL + 1 : CTRL + J : CTRL + K : CTRL + L : CTRL + M : CTRL + N : has the same function as the IAB key. moves the cursor one line down. has the same function as the HOMEI key. has the same function as the <u>SHIFT</u> key + HOME key. has the same function as the <u>RETURN</u> key. moves the cursor to a position next to the last character is the line. in the line.
- CTRL + R : has the same function as the INS key. CTRL + U : CTRL + X : CTRL + X : deletes the characters of the line at the cursor position. has the same function as the <u>SELECT</u> key. moves the cursor to the right.
- CTRL + ] CTRL + moves the cursor to the left.
- CTRL + `: moves the cursor up. CTRL + \_ (underline): moves the cursor down.

TAB) key This key is used to move the cursor to the next tab position. In MSX-BASIC, tabs are set at every eight characters. Any characters which the cursor goes over are deleted when the cursor moves to the next tab position

RETURN key Press this key to indicate the end of a line of data or commands input from the keyboard. Press this key every time you finish entering a line.

[ESC] (escape) key The function of this key is determined by the software used. Under MSX-BASIC, this key is inoperative.

[STOP] key Press this key to interrupt program execution or listing. You can restart

the program by pressing this key again. Pressing this key together with the <u>CTRL</u> key does the same. In this case, however, you can restart program execution with the CONT command, but listing cannot be continued.

# SELECT key

The function of this key is determined by the software used. Under MSX-BASIC, this key is not used.

## FUNCTION KEYS

Keys[F1]to[F3](F3]o F10) are called function keys. The functions of these keys are determined by the software. Therefore, read the relevant Software Guide for their functions. In MSX-BASIC, keys[F1] to[F3]function as follows (When these key are pressed while pressing the [SHIFT] key, they function as keys F6 to F10.):

Function key only	Function key + SHIFT key
F1 color	F6 color 15, 4, 4 RETURN
F2 auto	F7 cload"
F3 goto	F8 cont RETURN
F4 list	F9 list. RETURN
E5 run	E10 cls: run BETLIBN

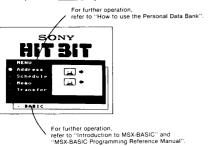

# 1-6. HOW TO START UP

# TO START UP THE PERSONAL DATA BANK OR MSX-BASIC

1. Turn on the monitor TV and the computer.

 Move the mark ♦ to the desired program of the Personal Data Bank or MSX-BASIC to be executed by using the cursor move keys. Then press the (<u>RETURN</u>) key.

# TO START UP A GAME

Insert the game cartridge into cartridge slot A with the illustration side toward you, or into the cartridge slot B with the illustration side up. Then turn on the monitor TV and the computer. For details, refer to the game instruction manual.

## Note

To power on the computer again, wait more than 10 seconds after it is turned off.

# 1-7. TO SAVE AND LOAD A MSX-BASIC PROGRAM

The MSX-BASIC program or data entered from the keyboard can be saved on a cassette tape, a data cartridge or a micro floppydisk. This chapter explains how to save a program on a cassette tape and load it from the tape. As to save or load the program using a data cartridge, refer to the instruction manual of the Sony HBI-55 Data Cartridge.

# TO SAVE A PROGRAM

- 1. Insert a cassette tape into the cassette tape recorder, and adjust the volume and tone control to a center position.
- Type the save command of MSX-BASIC from the keyboard. CSAVE "program name" Define the program name within six characters. The first character must be a letter.
- Press the REC (record)/SAVE button of the recorder. The tape starts as soon as the button is pressed.
- Press the **RETURN** key of the computer The program is then saved on the tape.
- 5. When a program has been saved and message "OK" is displayed on the screen, press the STOP button of the recorder.

# Note

When the remote control plug is connected to the recorder, the tape start and stop functions of the recorder are controlled from the computer.

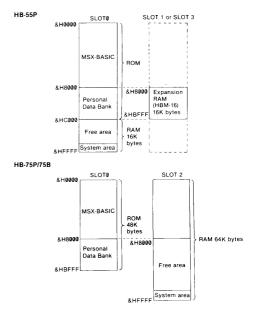

# 1-6

# TO LOAD A PROGRAM

- Insert the cassette tape containing the desired program into the cassette tape recorder and rewind the tape. Then adjust the volume and tone controls to an appropriate position.
- 2. Type the load command of MSX-BASIC from the keyboard. CLOAD "program name"
- 3. Press the RETURN key of the computer.
- 4. Press the PLAY/LOAD button of the recorder.
- 5. When loading is finished, press the STOP button of the recorder.

Note If the program is not loaded, readjust the volume and tone controls and try again.

# 1-8. MEMORY MAP

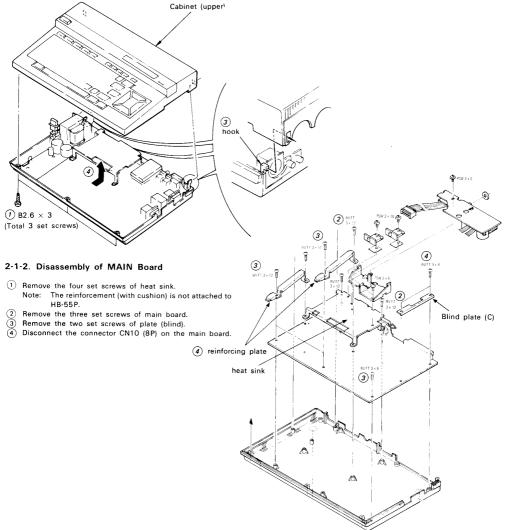

The capacity of the free area can be checked by the FRE function.

# **CHAPTER 2** SERVICE INFORMATION

# 2-1. DISASSEMBLY

# 2-1-1. Disassembly of Cabinet (upper)

- Remove the three set screws of cabinet (lower).
   Dis connect the connector CN11 (13P), CN12 (9P) on the main board and CN2 (2P) on the power board.
- 3) Take off the three hooks.
  4) Remove the cabinet (upper) in the direction indicated by the arrow.

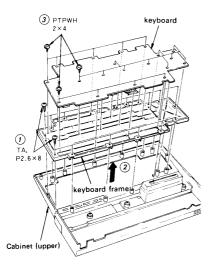

HB-55P/75P/75B(AE/UK)

# 2-1-3. Disassembly of Keyboard

CAUTION • HB-55P All the keytops are not locked, therefore

 remove the keyboard temporarily and taping it.
 HB-75P/75B The function key and cursor key are not locked, therefore remove the keyboard temporarily and taping it.

# 2-2. PROVIDING OF BASIC ROM AND FIRMWARE ROM

# 2-2-1. Basic ROM (IC42, 43)

Basic ROM (IC42 and IC43) provides one MASK ROM (MSM38256-70RS). To mount it to IC42, and switch JW5, JW7 to JW10 of MASK/EP switching jumpers to MASK ROM side. (remove IC43)

# 2-2-2. Firmware ROM (IC44)

Firmware ROM (IC44) provides MASK ROM (MSM38128A-77RS). Remove the jumper JW6 for EP ROM.

# 2-3. REPAIR PARTS

- Safety Related Components Warning. Components identified by shading marked with A on the schematic diagrams, exploded views and electrical spare parts list are critical to safe operation. Replace these components with Sony parts whose part numbers appear in this manual or in service bulletins and service manual supplements published by Sony.
- 2. Replacement Parts supplied from Sony Parts Center will sometimes have a different shape from the original parts. This is due to "accommodating the improved parts and/or engineering changes" or "standardization of genuine parts". This manual's exploded views and electrical spare parts list indicate the parts numbers of "the standardized genuine parts at present".

Regarding engineering part changes in our engineering department, refer to Sony service bulletins and service manual supplements.

- Printed Components in Bold-Face type on the exploded views and electrical spare parts list are normally stocked for replacement purposes. The remaining parts are not normally required for routine service work. Orders for parts not shown in Bold-Face type will be processed, but allow for additional delivery time.

5. Units for Capacitors, Inductors and Resistors

The following units are assumed in schematic diagrams, electrical parts list and exploded views unless otherwise specified: Capacitors: µF

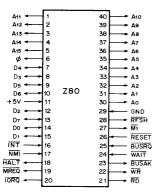

Inductors:	μH
Resistors:	ohm

2-2

# **CHAPTER 3** THEORY OF OPERATION

# 3-1. Z80 (CPU)

The Z80 has 40 pins, and they are arranged as follows:

# 3-1-1. Functions of Pins

- 1 A0 to A15 (Address bus)
- A bus line which outputs addresses when reading and writing of the memories and input/output operations. (2) Do to D7 (Data bus)
- A bus line which reads and outputs the data
- 3 MREQ and IORQ  $\overline{\text{MREQ}}$  is output when accessing to memory, and  $\overline{\text{IORQ}}$  is

output when accessing to I/O port. The I/O port is an address for controlling the printer and PSG. (4) RESH

Dynamic RAM (for example 4116) is not able to memorize unless it is refreshed at certain time intervals. RFSH is the timing signal for this refreshing purpose.

(5) M1

It indicates a cycle in which the CPU reads out a command to the exterior.

6 HALT

It is signal which informs the outside that the HALT (STOP) command has been executed and that CPU has ceased the carrying out of the program. This HALT will continue until it is interrupted or reset.

(7) WAIT

This is a signal which awaits the CPU processing until the peripheral device has completed its operation, since the peripheral device cannot catch up with the processing speed of the CPU.

- 8 INT and NMI
  - They are input pins for interruptions. NMI enables interruption at any time

INT enables prohibition of interruption in accordance with contents of a program.

(9) RESET

A pin which initializes the CPU.

HB-55P/75P/75B(AE/UK)

# (10) BUSRO and BUSAK

BUSRO is a pin which requests the CPU to disconnect addresses and data buses from the CPU.

 $\overline{\text{BUSAK}}$  is a pin which informs the exterior that the CPU accepts the BUSRO

(1) RD and WR WR signal is output when writing is performed for the memory or I/O devices.

RD signal is output when reading is performed for the memory or I/O devices.

# 3-1-2. Operation of Z80

When power supply of the Z80 is turned ON, RESET signal is fed to it to clear out its internal memory contents.

The RESET pin of the Z80 becomes active when set at "L". Therefore, when "L" signal is applied to it, the pins of the Z80 are established as follows:

[Address and data bus] Both become "H" level. (Floating condition)

[Control pins]

All the control pins output non-active signals. The signal level of these pins when the Z80 is in active mode is 'L' level; therefore, in this state, the Z80 outputs "H" level. [Program counter]

The contents of the program counter become 0000H.

[Interruption enabling flip-flop]

Becomes zero and becomes prohibition of interruption. [Interruption mode]

The interruption mode becomes zero.

[Interruption page address register]

The contents of I register become OOH.

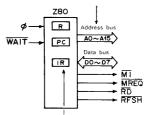

[Refresh register]

The contents of R register become OOH. [Register file]

The contents of all registers such as A, B, C, D, E, F, A', B', C', D',

E', F', IX, IY, H, L, and R become 00H. When RESET becomes "H" from "L", the Z80 starts to execute operation of the program; however, the contents of the program counter (PC) become command fetch address. This means that the operation code comes from the 0000H address. The Z80 fetches the operation codes when it internally becomes into "a condition to execute operation fetch codes'

At first, the contents of the program counter (PC) are output, and then the contents of the refresh register (R) are output after the Z80 fetches the operation code.

From the address of the memory, which is specified by the program counter, a part of the operation code is fetched to the command register (IR).

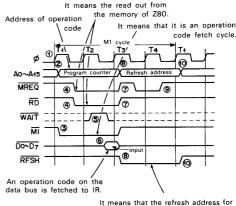

# 3-1-3. M1 Cycle

sequence to fetch an operation code is called M1 cycle

- When the Z80 becomes M1 cycle. 1
- During the interval between the arrivals of the first clock signal and the second clock signal (it is called T1 state), the contents of the program counter are output to the address bus.
- When it is also in the T<sub>1</sub> state, "L" is output to  $\overline{M1}$ . At this time, the Z80 is operating in M1 cycle, and it plays a role to 3 inform the outside that an address to fetch the operation code on the address bus is being output.
- When it is also in the T1 state, "L" is output to MREQ and (4) BD Access the memory with these signals and fetch the
- operation code (to the command register). (5) When it is in T2 state, if an external input to WAIT pin of the Z80 is "H", the Z80 moves to T3 state. If the WAIT pin is in
- "L" level, the Z80 does not move to T3, but it becomes in wait state (TW), and waits until it becomes "H". (6) At a point when the Z80 moves to T3 state from T2 state, it
- fetches the operation code, which is read out on data bus (D7 to D0) from the memory, to the command register (when the clock of T3 is being raised up).
- (7) In T3 state, MREQ becomes at first "H" and then returns to 'L'' again.
- (8) In T3 state, the contents of the refresh register are output to the address bus. However, among the 8 bits of the refresh register, the lower 7 bits are output to the lower 7 bits of the address bus.

To indicate that the refresh address is being output to the address bus, "L" is output to RFSH pin.

- (9) When the Z80 becomes in T4 state, the  $\overline{\text{MREQ}}$  signal returns to "H" from "L".
- It becomes possible to refresh the dynamic memory with the  $\overline{\text{MREQ}},~\overline{\text{RFSH}}$  and the address bus.
- (10) In the following Fig., up to the T4 state shows an operation code fetch cycle. The place marked 10 denotes the Ti state in a cycle whichever comes next. (It depends on the command fetched immediately before.) Up to this point, the refresh address has been output to the address bus, and RFSH signal which indicates the above mentioned state has been set at "L". However, the RFSH signal also becomes "H" simultaneously when the refresh address on the address bus disappears.

dynamic memory is being output to address bus

Command OP code fetch cycle (M1 cycle)

# 3-1-4. Refresh Cycle

Refresh cycle is an indispensable and troublesome operation for DRAM. The memorized contents of the memory will be erased unless the specified row address is not accessed within the determined length of time. The term of row address access used here means that only row address and RAS are necessary.

Accordingly, even in a normal read cycle and a write cycle, refresh has been completed against their row addresses

The Z80 CPU outputs address in T1 and T2 of the OP code fetch cycle and indicates the output to the memory, and it fetches OP code at the clock rising up of T<sub>3</sub>, and performs refresh of the dynamic memory at the rest of 2 states (T<sub>3</sub> and T<sub>4</sub>).

There are two methods of refreshing. The first method is to refresh the 128 row addresses continuously (Burst mode refreshing) and the other is a dispersing method to refresh each row within 2ms (Single mode refreshing).

The Z80 is so designed as to be refreshed by conveniently using the latter method.

For the Z80, refreshment is performed so that a row address is refreshed once every M1 cycle. During the refreshing operation, CAS output is kept at H level.

Simultaneous refreshing is possible even if the data outputs of several memories are connected with the wired OR. The refreshing operation is a quasi read operation, and data in the memory is not output at that time.

The refreshing operation using only RAS is called RAS only refreshment. Driving of refreshing cycle of the dynamic memory can be performed by the RFSH and MREQ signals.

HB-55P/75P/75B(AE/UK)

# 3-2. OPERATION WHEN POWER SUPPLY IS TURNED ON

When the power supply is turned ON, "L" signal is applied to pin 3 of IC26 during several hundreds msec with a time constant of R106 and C49. This "L" signal is inverted to "H", and applied to pin\_35 (RESET) of IC16 (PP!). Furthermore, this "H" signal is inverted to "L" signal, and it is applied to pin 26 (RESET) of IC41 (CPU). (IC26 is an inverter of the Schmitt trigger type.) When resetting signal is applied to IC41 (CPU), the CPU turns all of its controlling pins and address data buses to "H" levels. Pin 6 of IC21 is at "H" level. Pin 6 becomes "H" level, since "L" level is applied to pin 1 of IC21 with RESET signal. IC16 (PPI) is initially set, and this condition contunues until

something is written into A port. When pin 6 of IC21 turns to "H", it turns pins 1 and 15 of IC17 to "H". When pins 1 and 15 of IC17 become "H", pins 7 and 9 both become "L"

When pin 26 of IC41 turns to "H" from "L", this releases the resetting of the CPU, and it outputs 0000H into the address bus and turns  $\overline{\text{MREQ}}$  signal to "L". Furthermore, pin 2 of IC37 turns to "H" with the inverter of IC38.

HTST signal ("H") is applied to pin 1 of IC37. The output of "H" of IC37 is inverted with IC38 and "L" signal is applied to pin 1 of IC23. This turns pin 4 to "L". This "L" signal is applied to pins 1 and 4 of IC53. On the other hand, MREQ signal and signals of the address bus

AB14 and 15 are applied to pins 1 , 2 and 3 of IC18, respectively.

Pin 4 becomes "L", as "L" level signal is applied to pins 2 and 3 of IC18.

Owing to this, pins 9 and 12 of IC33 become "L". However, of IC31 is set at "L" and pin 3 of IC31 is set at "H" by pin 2 the RESET signal "H", and "L" level of pin 12 of IC33 turns pin 5 of IC53 to "L". By turning BRD signal to "L", pins 3, 4, and 5 of IC53 are all turned to "L".

22 of IC44 becomes "L", and a program Consequently, pin stored in MASK ROM of FIRMWARE starts to run. (At this point, BASIC has not started yet.)

This program is a PLL Setting Data Sending Out Program which sends the data to IC31. Signals are fed from pins 7, 10, and 15 of IC31 to pins 2, 3, and 4 of IC7, and then the PLL starts to operate. Subcarrier of 4.43MHz of PAL signal is oscillated

After that pin 3 of IC31 is set at "L" and pin 2 is set at "H" Accordingly, pin 8 of IC33 becomes "L", and pin 2 in 6 IC32 also becomes "L", and output of pin 6 becomes "L". Pins 1, 2, and 13 of IC53 become "L", and pins 22 of IC42 and

IC43, also become "L" IC42 (BASIC ROM) is selected and is entered into BASIC program.

Pin 20 (CE) of IC42 is connected to AB14 of the address bus. When AB14 becomes "H", ROM of IC42 is unable to be selected. (IC42 has a capacity of 16K bytes from 0000H to 3FFFH.)

Since AB14 is inverted and connected to pin 20 (CE) of IC43, when AB1s becomes "H", pin 20 (CE) of IC43 becomes "L". At the same time, AB1s and AB1s of the address bus are connected to the inputs of pins 2 and 3 of IC18, and because AB1s is at "H" and AB1s is at "L", output of pin 5 becomes "L" and pin 6 of IC32 becomes "L". This causes pin

22 (OE) of IC43 to become "L" through IC53 and IC38, and to select ROM of IC43. (IC43 has a capacity of 16K bytes from 4000H to 7FFFH.) When

address becomes 8000H next to 7FFFH. AB15 becomes "H" and AB14 becomes "L".

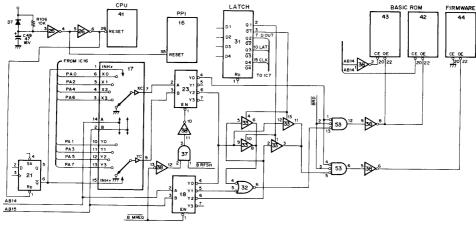

This address data is applied to IC17 and IC18, and the contents of pins 4 (X2), and 12 (Y2) are output to pins 7 (XC) and 9 (YC). However, as they have all become "L", thus the output of pin 4 of IC23 becomes "L". This signal is applied to pins 1 and 4 of IC53.

On the other hand, as address data AB15 ("H") and AB14 ("L") are applied to pins 2 and 3 of IC18, output of pin 6 becomes 'L'' and outputs of others become ''H''. As pins 4 and 5 of IC18 become "H", "H" is output to pin  $\,6\,$  of IC32. Accordingly, "H" is applied to pin  $\,13\,$  of IC53, so that pin  $\,12\,$ 

of IC53 becomes "L" and output of pin 9 of IC38 becomes "H", and ROMs of IC42 and IC43 cannot be selected. On the other hand, output "L" of pin 6 of IC18 is input to pin 2 of IC33 and "L" is output to pin 3 (pin 1 of GATE is at "H"). Then pins 3, 4, and 5 of IC53 all become "L", and output "H" of pin 6 of IC53 is inverted with IC38, and thus pin 6 of IC38 becomes "L"

The pin 6 of IC38 is connected to pin 22 (OE) of IC44 and it ). The ROM of IC44 is 6 of IC53 becomes "L" selects IC44 (FIRMWARE ROM). continuously selected until pin (9000н).

Accordingly, IC44 is capable of using 8000H to 8FFFH.

# 3-3. CHECKING SLOT

When the MSX-BASIC program starts operation, it executes initial setting and then checks the slot. The checking is performed in sequential order beginning with slot 0.

In this system, slot 0 is the memory stored within this system, and slot 1 is the upper cartridge slot and slot 3 is the rear cartridge slot.

In the HB-75, MAIN RAM 64K is assigned to slot 2.

When IC44 is selected, the program of IC44 is performed. During the performance of this program, check to see what kind of items are inserted into this cartridge slot. At this time, if instantaneously executable ROMs such as game cartridge are inserted, execution of controlling is shifted to them.

Selection of the slots is performed with IC23. IC23 is controlled with data from the PPI(IC16).

with data from the PPI(IC16). When pin 4 of IC23 is "L", slot 0 is selected. When pin 5 of IC23 is "L", slot 1 is selected. When pin 6 of IC23 is "L", slot 2 is selected. When pin 7 of IC23 is "L", slot 3 is selected.

Selection of the memories is performed with IC18, and it works as follows:

4 and 5 of IC18 are "L" (addresses 0000H to When pins

7FFFH), MSX-BASIC ROMs of IC42 and IC43 are selected. When pin 6 is "L" (addresses 8000H to 8FFFH), IC44 is selected.

When pin 7 of IC18 is "L" (address over COOOH), MAIN RAM is selected. (HB-55P).

IC23 (2/2) selects ROM of the cartridge slot. IC23 (2/2) operates only when the  $\overline{MREQ}$  and  $\overline{RD}$  are "L", and selects ROM of the cartridge slot.

Interchange of data between cartridge slots and external I/O is carried out through IC40, and IC40 is controlled by IC52, IC37, and IC38.

When pin 19 of IC40 is "H", it becomes in the OFF state, and interchange of data is accordingly not carried out. When the CPU is accessed to PPI, PSG, and VDP, it turns pin 19 to "H" and closes the gate. The circuit diagram at that time is as shown in Fig. 1.

3-4

# HB-55P/75P/75B(AE/UK)

of IC40 becomes "H": When pin 19

- When the IORQ signal is at "L" level, and either one of PPI, PSG, and VDP is at "L" level. 1.
- When either one of the  $\overline{\text{M1}}$  signal or  $\overline{\text{IORQ}}$  signal is at 2. "H" level.
- When the slot 0 is selected, (The ICs 29 and 30 are so 3. designed as to input "L" level always to pin 10 of IC27 when addresses are 0000H to FFFH.)

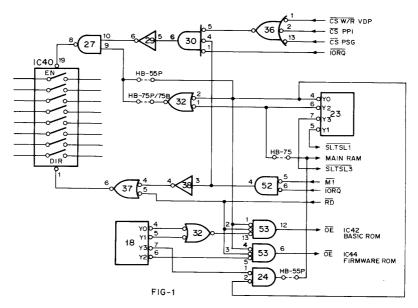

When one of the conditions is applicable to the above-mentioned 1 to 3, the data coming through IC39 are not carried out.

• When pin 19 of IC40 becomes "L", interchange of data is carried out, and the direction of the inerchange of data is determined by pin 1. When pin 19 becomes "L":

Any slot except slot 0 is selected. 1

- 2. When access is not performed to the internal I/O device (PPI, PSG and VDP).
- When the above-mentioned two conditions are coincided. When pin 19 is at "L" level and pin 1 is at "H" level, data are sent out from interior of the system.

When pin 1 is at "L" level: When  $\overline{RD}$  is at "L" level, or  $\overline{M1}$  and  $\overline{10RQ}$  are simultaneously at "L" level. Except for the above, they are all "H" level. When pin 1 is at "L" level, data are read into the system from the exterior.

Each pin of the cartridge slot

Pin No.	Name	Content	
1	CS1	Address selecting signal of memory 4000H to 7FFFH	
2	CS2	Address selecting signal of memory 8000H to BFFFH	
3	CS12	Address selecting signal of memory 4000H to BFFFH (for 256K ROM)	
4	SLTSL	It is a slot selecting signal, which applies selecting signals peculiar to each of the respective slots.	
5	Spare	Spare signal line for future use (Prohibited to be used)	
6	RFSH	Refreshing cycle signal	
7	WAIT	WAIT request signal for CPU (Timing should be taken at the interior of the	
		system.)	
8	INT	Interruption request signal for CPU	
9	M1	Indicating signal of fetch cycle of CPU	
10	BUSDIR	Direction control signal of external data bus buffer	
11	IORO	Request signal of I/O	
12	MREQ	Request signal of memory	
13	WR	Write timing signal	
14	RD	Read timing signal	
15	RESET	System reset signal	
16	Spare	Spare signal line for future use (Prohibited to be used)	
17 to 32	AO to A15	Address bus signal	
33 to 40	DO to D7	Data bus signal	
41 and 43	GND	Ground	
42	CLOCK	CPU CLOCK (3.579545MHz)	
44 and 46	SW1 and SW2		
45 and 47	+5V	Power supply of +5V	
48	+12V	Power supply of +12V	
49	SUNDIN	Sound input signal (-5 dBm)	
50	-12V	Power supply of -12V	

HB-55P/75P/75B(AE/UK)

# 3-4. I/O PORT

For selecting of I/O port, address decoder of IC23 is used. The following operations are performed in order that the CPU accesses to the I/O port.

# 3-4-1. Selection of I/O Port

# When reading out

- Number of input port is output to the address bus.
   When it is in T<sub>2</sub> state, "L" is output to IORQ and RD. This
- means to access input port. (3) When WAIT is either "L" or "H", the Z80 moves automatically to Tw.
- If in TW state, if the input to WAIT is at "H" level, the Z80 extricates itself from the Tw state and shifts into T3 state.
- (5) The data which are read out from the input port on the data bus are read into interior of the Z80. At this time, the IORQ and RD return to "H" from "L".

# When writing in

- 1)' Number of output port is output to an address.
- Number of builds port is output for is output to the data 0" Data to be written onto the output port is output to the data bus.
- (2)' In T2 state, "L" is output to the  $\overline{IORQ}$  and  $\overline{WR}$ .
- This means to access output port. (3) Whether the WAIT is "L" or "H", the Z80 moves
- automatically to Tw.
  (a) In Tw state, if the WAIT is "L", the Tw state is continuously inserted; however, if the WAIT is "H", the Z80 moves to T3
- state. (5) In T3 state, the  $\overline{IORQ}$  and  $\overline{WR}$  return to "H" from "L". This means that the data has been written out to the output port.

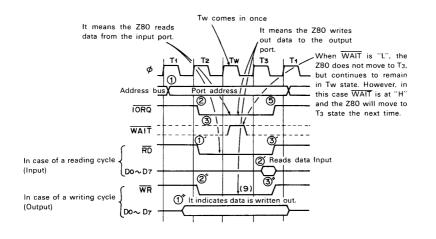

The signal on the address bus of the input and output commands are output to the lower 8 bits of input and output port numbers, and the contents of the accumulator or B register are output to the upper 8 bits of the signal. As and A4 of the address bus are applied to input pins 13 and 14 of address decoder of IC23. Furthermore, A4 to A7 of the address bus are applied to pin 15 (EN) through IC25, IC27, IC28, IC29, and IC37. Depending on this signal, it is determined that which I/O device is selected. The selection can be made as follows:

A7	A6	A5	A4	Aз		I/O port address
1	0	0	1	0	PRINTER	90H, 91H
1	0	0	1	1	VDP	98H, 99H
1	0	1	0	0	PSG	AOH~A3H
1	0	1	0	1	PPI	A8H~ABH

These are all selected when the  $\overline{\text{IORQ}}$  and  $\overline{\text{RD}}$  or  $\overline{\text{WR}}$  signals are output.

# 3-4-2. Operation of Each Port

- PRINTER: It sets data at 91H and outputs data at 90H (strobe pulse and BUSY pulse).
- VDP: 99H means time to transfer address, and 98H means time to transfer data.
- PSG: AOH Specifies register.
  - A1H Write data into register. A2H Contents of register are output to data bus. A3H Not operated
- PPI: When RD is "L":
  - ABH Contents of port A are output to data bus. A9H Contents of port B are output to data bus. AAH Contents of port C are output to data bus.
  - ABH is prohibited. When WR is "L":
    - A8H Contents of data bus are output to port A.
    - A9H Contents of data bus are output to port B.
    - AAH Contents of data bus are output to port C.
    - ABH Contents of data bus are written into control register.

3-6

# 3-5. ACCESS TO MAIN RAM (HB-55P)

In the HB-55P system, a RAM of 16K bytes is mounted. Access to the is RAM can be carried out when the address data becomes over CO00<sub>H</sub>.

# 3-5-1. When Data is Read Out from RAM (HB-55P)

Address data is applied to input pins of IC49 and IC57, and at this time, the pins 1 (A) of IC49 and IC57 become "L"; accordingly, the contents of the 0 group are output to the output pins. These form a ROW address. Nextly, when pin 19 (MREQ) of IC41 (CPU) becomes "L", the signal is applied to pin 12 of IC37. Accordingly, "L" is output to pin 11 of IC37. This signal is applied to pin 2 (D) of IC51. A clock signal is applied to pin 3 of IC51, and with the rising up of this clock signal the contents of pin 2 are output to pin 5. Owing to this, "L" is applied to each RAS pin of the dynamic RAM of IC58 to IC61 and IC65 to IC68.

Consequently, the ROW address is latched into the memory. MREG signal from IC41 (CPU) is applied to pin 1 of IC18. At this time, since signals of AB14 and AB15 of the address data are applied to pins 2 and 3 of IC18, all these pins become "H"; accordingly, pin 7 of IC18 becomes "L". This signal is applied to pin 1 of IC24. At this time, pin 2 of IC24 is also "L" and therefore, pin 3 of IC24 becomes "L", and the signal is also applied to pin 12 of IC50.

As IC50 operates in just the same manner as the abovementioned IC51, pin 9 of IC50 becomes "L". At this time, pin 8 of IC50 becomes "H" and the signal is applied to pins 1 of IC49 and IC57 . Accordingly, contents of 1 group are output to the outputs of IC49 and IC57. (It becomes COLUMN address.) The signal from pin 9 of IC50 is applied to pin 12 of IC51, and its contents are output to pin 9 of IC50 with the clock signal. It takes 10ns for this process. (10ns delayed).

During this time interval, the address data depending on outputs of IC49 and IC57 becomes stable. The pin 9 of IC51 is connected to pin 15 ( $\overline{CAS}$ ) of the dynamic memory, and by setting it to "L" the COLUMN address is latched into memory. When MREQ signal becomes "H" from "L", pin 2 of IC51 becomes "H" from "L", pin 6 of IC51 becomes "L" from "H", and this signal is applied to pins 10 (PRESET) of IC50 and IC51 to shift the output of pin 9 of IC51 to "H".

As a result, pin 15 (CAS) of the memory becomes "H" and the contents of the previously set address becomes to be read out from the memory.

When RFSH signal of "L" level is applied to pin 13 of IC37 from the CPU, pin 11 of IC37 also becomes "L", and the signal is also applied to pin 2 of IC51. Therefore, "L" is output to pin 5 of IC51 and the refreshing of the dynamic memory is carried out.

When pin 13 (signal of  $\overline{\text{RFSH}}$ ) and pin 12 (signal of  $\overline{\text{MREQ}}$ ) of IC37 all become "H", pin 5 of IC51 becomes "H" and pin 4 ( $\overline{\text{RAS}}$ ) of the memory becomes "H".

# 3-5-2. When Data is Written into RAM (HP-55P)

When data is written in,  $\overline{MRE\Omega}$  signal and  $\overline{WR}$  signal of "L" level are output from the CPU. The process to set an address to the memory is the same as in the data reading out.

memory is the same as in the data reading out. Output timing of WR signal from the CPU is slightly later than that of MREQ signal. Therefore, during this time interval, setting of address is carried out.

 $\overline{\text{WR}}$  signal is applied to pin  $\,9\,$  of IC24 and  $\overline{\text{MREQ}}$  signal is applied to pin  $\,10$  .

When pins 9 and 10 are "L", pin 8 becomes "L", and shift pin 3 ( $\overline{WE}$ ) of the memory to "L" to write in the data to the address which has previously been set.

# 3-5-3. Dynamic RAM (4116) (HB-55P)

(-5V)VBB	1	16 VSS (GN C	0
DIN	2	15 CAS	
WRITE	3	14 Dout	
RAS	4	13 A6	
Ao —	5	12 A3	
A2	6	11 A4	
A1	7	10 A5	
(+12V) VDD	8	9 Vcc(+5V	)

Ao - A6	Address input
CAS	Column address strobe
DIN	Data intput
DOUT	Data output
RAS	ROW address strobe
WRITE	Read/write input
VBB	Power supply (-5V)
Vcc	Power supply (+5V)
VDD	Power supply (+12V)
Vss	GND

The above shows the pin connection diagram of dynamic RAM (4116).

The memory cells of 16384 (1024 $\!\times\!6)$  are composed of 128 rows $\!\times\!128$  columns.

To select each memory cell, 7 bits of ROW address and 7 bits of column address are necessary. However, there are only 7 (Ao to A6) address input pins on the memory chip.

As a result, to input 14 bits of an address to the memory chip, input has to be carried out twice, that is by dividing the 14 bits of address into two parts of 7 bits each.

# 3-5. ACCESS TO MAIN RAM (HB-75P/75B)

In the HB-75P/75B system, a RAM of 64K bytes is mounted. Access to this RAM can be carried out when the slot 2 is selected.

# 3-5-1. When Data is Read Out from RAM (HB-75P/75B)

Address data is applied to input pins of IC49 and IC57, and at this time, the pins 1 (A) of IC49 and IC57 become "L"; accordingly, the contents of the 0 group are output to the output pins. These form a ROW address. Nextly, when pin 19 (MREQ) of IC41 (CPU) becomes "L", the signal is applied to pin 12 of IC37. Accordingly, "L" is output to pin 11 of IC37. This signal is applied to pin 2 (D) of IC51. A clock signal is applied to pin of IC51, and with the rising up of this clock signal the 3 contents of pin 2 are output to pin 5. Owing to this, "L" is applied to each RAS pin of the dynamic RAM of IC58 to IC61 and IC65 to IC68.

Consequently, the ROW address is latched into the memory. MREQ signal from IC41 (CPU) is applied to pin 1 of IC18. At this time, since signals of AB14 and AB15 of the address data are and mine, since signals of Ad14 and AB15 of the address data are applied to pins 2 and 3 of IC18, all these pins become "H"; accordingly, pin 7 of IC18 becomes "L". This signal is applied to pin 1 of IC24. At this time, pin 2 of IC24 is also "L" and therefore, pin 3 of IC24 becomes "L", and the signal is also applied to pin 12 of IC50.

As IC50 operates in just the same manner as the above mentioned (IC51, pin 9 of IC50 becomes "L". At this time, pin 8 of IC50 becomes "H" and the signal is applied to pins 1 of IC49 and IC57 . Accordingly, contents of 1 group are output to the outputs of IC49 and IC57. (It becomes COLUMN address.) The signal from pin 9 of IC50 is applied to pin 12 of IC51, and its contents are output to pin 9 of IC50 with the clock signal. It takes 10ns for this process. (10ns delayed).

During this time interval, the address data depending on outputs of IC49 and IC57 becomes stable. The pin 9 of IC51 is connected to pin 15 (CAS) of the dynamic memory, and by setting it to "L" the COLUMN address is latched into memory. When  $\overline{\text{MREO}}$  signal becomes "H" from "L", pin 2 of IC51 becomes "H" from "L", and pin 5 (Q) also becomes "H". Accordingly, pin 4 (RAS) of the memory becomes "H" from "L". Pin 6 of IC51 becomes "L" from "H", and this signal is applied to pins 10 (PRESET) of IC50 and IC51 to shift the output of pin 9 of IC51 to "H".

As a result, pin 15 (CAS) of the memory becomes "H" and the contents of the previously set address becomes to be read out memory. from the

When RFSH signal of "L" level is applied to pin 13 of IC37 from the CPU, pin 11 of IC37 also becomes "L", and the signal is also applied to pin 2 of IC51. Therefore, "L" is output to pin 5 of IC51 and the refreshing of the dynamic memory is carried out.

When pin 13 (signal of RFSH) and pin 12 (signal of MREQ) of IC37 all become "H", pin 5 of IC51 becomes "H" and pin 4  $(\overline{RAS})$  of the memory becomes "H".

3-8

# 3-5-2. When Data is Written into RAM (HP-75P/75B)

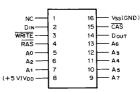

When data is written in,  $\overline{\mathsf{MREQ}}$  signal and  $\overline{\mathsf{WR}}$  signal of "L" level are output from the CPU. The process to set an address to the memory is the same as in the data reading out.

Number of the same sector of the sector of of address is carried out.

WR signal is applied to pin 9 of IC24 and MREQ signal is

applied to pin 10. When pins 9 and 10 are "L", pin 8 becomes "L", and shift pin 3 ( $\overline{WE}$ ) of the memory to "L" to write in the data to the address which has previously been set.

# 3-5-3. Dynamic RAM (3764) (HB-75P/75B)

A0 - A7	Address input
CAS	Column address strobe
DIN	Data input
DOUT	Data output
RAS	ROW address strobe
WRITE	Read/write input
Vdd	Power supply (+5V)
Vss	GND

The above shows the pin connection diagram of dynamic RAM (3764)

The memory cells of 65536 (4096  $\!\!\times\!\!16)$  are composed of 512 rows ×512 columns.

To select each memory cell, 8 bits of ROW address and 8 bits of column address are necessary. However, there are only 8 (A0 to A7) address input pins on the memory chip.

As a result, to input 16 bits of an address to the memory chip, input has to be carried out twice, that is by dividing the 16 bits of address into two parts of 8 bits each.

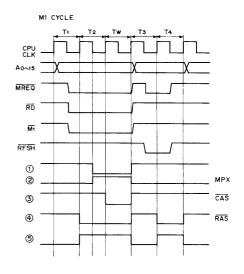

HB-75P/75B(AE/UK)

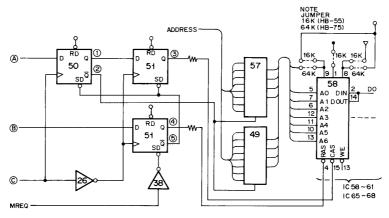

# 3-5-4. Read Cycle Procedure

- (1) Determine the row address.
- Drop RAS. (Internally latch the 7-bit (HB-55)/8-bit (HB-75) (2) row address.)
- (3) Determine the column address.
- Drop CAS. (Internally latch the 7-bit (HB-55)/8-bit (HB-75) (4) row address.)

- (5) Raise <u>RAS.</u>
  (6) Raise <u>CAS</u> after reading data.
  The write cycle, excluding WRITE, is carried out in the same manner as the read cycle.

There are 2 write modes. One is called the early write mode in which  $\overline{\text{WRITE}}$  falls before  $\overline{\text{CAS}}$  falls. The other is called the delay write mode in which  $\overline{\text{WRITE}}$  falls while  $\overline{\text{CAS}}$  is being low. The read cycle is normally carried out in the early write mode.

- (A): When the signal in line (A) is set at "L" by Memory Select, a read/write operation can be done for the memory.
  (B): When the signal in line (B) is set at "L" by Memory Select/Refresh, RAS is issued.
- C: The signal in line C indicates the same clock as CPU CLOCK.

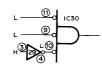

HB-55P/75P/75B(AE/UK)

# 3-6. PRINTER

IC30 is a 3-input NOR gate. When all input signals are "L", the output signal at pin 8 of IC30 is "H". Pin 8 of IC30 is connected to pin 11 of IC39. When the signal at pin 8 of IC30 is "H", data can be IC39.

The following signals are applied to IC30.

- a. When both IORQ and WR are "L", the signal at pin 11 of IC30 is "L".
- When pin 9 of IC30 is selected by address decoder, the signal at pin 9 of IC30 becomes "L".

c. When ABO in the address bus is "H", the signal at pin 10 of IC30 is "L".

In the above state, data can be issued on the printer. Thereafter, the printer starts printing data when a strobe signal is issued to the printer.

Select 91H at the I/O port, latch the print data, and send a strobe signal in 90H. Then, control accesses the printer.

The strobe signal is issued in the following manner. Signals identified by a, b, and c are fed to inverter IC29 and NOR

gate IC28.

The I/O port is set in 90H at this time. ABO in the address bus is low and the address decoder (at pin 10 of IC23) selects the printer. Thus, both  $\overline{IORQ}$  and  $\overline{WR}$  become "L".

printer. Thus, both IORQ and WR become "L". The input signals at pins 11 and 12 of IC28 are "L" and the otuput signal at pin 13 of IC28 is "H". The input signal at pin 13 of IC29 is "L" and the output signal at pin 12 of IC29 is "H". The signals at pin 13 of IC28 and pin 12 of IC29 are fed to pins 13 and 12 of IC27, respectively. The signal at pin 11 of IC27 becomes "L" and it is fed to pin 3 of IC34. When either IORQ or WR becomes "H", the signal at pin 13 of IC29 becomes "H". The signal at pin 12 of IC27 becomes "L" and the signal at pin 11 of IC27 becomes "H". It causes the signal at pin 3 of IC34 becomes "H" from "L". Data fed to pin 2 of IC34 is issued to pin 6 of IC34 while the signal at pin 3 of IC34 rises. Data at pin 2 of IC34 is "L" at that time, and the signal at pin 6 of IC34 becomes "H". Thus, the signal at pin 8 of IC25 becomes "H" to turn on Q27. Thus,  $\overline{PSTB}$  causes the printer to start printing data.

Data cannot be received by the printer when the printer is performing a printing operation. In this state, the printer issues BUSY to the controller. BUSY is used to decide whether or not data is to be sent to the printer. BUSY is fed to pin 12 of IC34 through IC25. In this state,  $\overline{M1}$  is fed to pin 9 of IC12 (1/4).  $\overline{M1}$  informs the controller that operation codes are being fetched by the CPU. The inverted  $\overline{M1}$  is fed to pin 11 of IC34. Data appearing at pin 12 of IC34 is issued to pin 9 (Q) of IC34 and then fed to pin 14 of IC55. (BUSY)

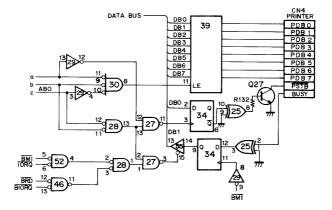

TORO is fed to pin 6 of IC52. When the signals at pins 5 and 6 of IC52 become "H", the signal at pin 4 of IC52 becomes "L". MI becomes "H" speedily, and thus the signal at pin 4 of IC52 becomes "L" at the end of MI. It is then fed to pin 2 of IC28.

When both  $\overline{IORO}$  and  $\overline{RD}$  are "L", the signal at pin 3 of IC28 is "L". When the signals at pins 2 and 3 of IC28 become "L", the signal at pin 1 of IC28 becomes "H" and then it is fed to pin 1 of IC27.

Pin 13 of IC28 is connected to pin 2 of IC27. Both the input signals at pins 11 and 12 of IC28 are "L" since the I/O port is set in 90H.

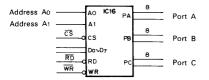

Both the signals at pins 1 and 2 of IC27 become "H", the signal at pin 3 of IC27 becomes "L", and the signal at pin 15 of IC55 becomes "L" to send data from pin 14 to pin

13 of IC55. Data is input to microprocessor Z80 so as to check whether or not data is BUSY.

3-10

# 3-7. PROGRAMMABLE PERIPHERAL INTERFACE (PPI) IC16

The diagram above shows the functions of 8255A.

The 8255A is a programmable, general-purpose I/O device designed to construct a 8-bit microcomputer system, and it is characterized by the followings: (1) An arbitrary function can be selected at the 24 bit I/O

- terminal by program specification.

(2) Power is supplied from a single 5V power supply.
(3) The direct bit set/reset function is provided.
When RD is set active by making it "L" in the read mode or when  $\overline{\text{WR}}$  is set active by making it "L" in the write mode, data can be

- transferred between the data bus and each port.  $\overline{CS}$  (CHIP SELECT): By setting  $\overline{CS}$  at "L", communication of 8255A with the CPU is permitted. When  $\overline{CS}$  set at "H", the data bus has high impedance and control from the CPU is disregarded
- WR (WRITE): WR is a write enable signal for the 8255A. When WR is "L", data or control words can be written into the 8255A.
- Ao and A1 (PORT ADDRESS): They are used to select and control port A, port B, port C, or the control register when combined with  $\overline{RD}$  or  $\overline{WR}$ . They are also used as low order 2 bits (Ao and A1) for the CPU address bus.
- RESET: When RESET is "H", data in all registers (including the control register) within the 8255A is cleared.

All the ports are set in the input mode after register contents are cleared.

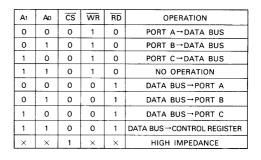

0 0 0 PC0 0 0 1 PC1 0 1 0 PC2

PC7

	PC0~7	; PORT C IN/OUT
	RD	; READ
	WR	; WRITE

The 8255A provides 3 basic modes one of which can be selected by system software.

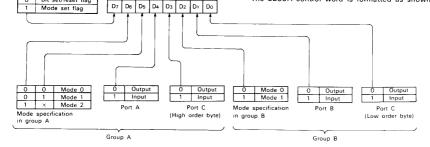

(1) Mode O	Port A	Port B	Port C				
	1/0	1/0	High order byte I/O	Low order byte I/O			
(2) Mode 1	Gro	up A	Group B				
	Port A I/O	Port C High order byte I/O (Interrupt control)	Port B I/O	Port C Low order byte I/O (Interrupt control)			
(3) Mode 2	bidirection port C cons	for group A. 8 al bus. 5 bits stitute a contr ute an I/O bus ntly.	in the high o ol bus and th	order byte at ne remaining			

This machine uses the 8255A in mode 0.

When RESET is set at "H", all the ports are set at high impedance.

Each port remains the input mode after RESET becomes "L", and thus it can be set in the other mode by an output instruction during system program execution.

The 8255A control word is formatted as shown below.

Set Reset

HB-55P/75P/75B(AE/UK)

When using C port as an output port, any 1 bit only out of the 8 bits in the C port may be SET (H level)/RESET (L level) with the control word from the CPU.

In this way, the program or data may be SAVEd to the TAPE.

76543	2 1	0			
$0 \times \times \times$					
1	~	-t			n SET (H),
	1		and at	"0" whe	n RESET (L).

Port C	3	2	1
PC7	1	1	1
PC6	1	1	0
PC5	1	0	1
PC4	1	0	0
PC3	0	1	1
PC2	0	1	0
PC1	0	0	1
PC0	0	0	0

The signal system when recording tape with MSX is performed by FSK modulation and start-stop synchronization (nonsynchronization) system. This signal is already generated in the software.

The FSK modulation is a system whereby the frequency of carrier wave may be increased or decreased when the data is either '1' or '0''. In the MSX, when the transmitting speed is 1200 buads, it is 1200Hz at '0'', and 2400Hz at '1''. These are all performed in the software of the MSX. Usually when transmitting or receiving data, it is necessary to set the rules beforehand by the transmitting side and receiving procedures. The start-stop synchronization system is a system whereby the start bit is firstly placed at the head of the data, and nextly comes the data of the predetermined number of bits and the parity bit, and followed lastly by the stop bit.

In the MSX, a single data is transmitted by 10 bits which are comprised of 1 bit of start bit, 8 bits of data bits and 1 bit of stop bit.

The CPU sends these signals through PPI (IC16).

# 3-8. PROGRAMMABLE SOUND GENERATOR (PSG) IC48

The IC48 at PSG is possible to make sounds through 3 channels with a single IC, and may also generate noise. The interior of the PSG is arranged in the manner shown in the

diagram on the next page.

Register 0 to 5 determine the frequency of each respective channels and are called channel A, channel B and channel C. As registers 1, 3, and 5 are divided by 4 bits, the values of 0 to 15 are input into these registers. As registers 0, 2, and 4 are divided by 8 bits, the values of 0 to 255 are input into these registers. Register 6 determines the noise frequency and is divided by 5 bits, the values of 0 to 31 are input into this register.

Register 7 is a switch, and it performs the ON/OFF of the sound of the respective channels or generates noise only.

As this register is negative logic, it becomes activated at "L". When all are turned ON they become 00H, and when all are turned OFF they become 3FH.

Registers 8, 9, and 10 are for use in adjusting the volume of the respective channels, and when bit 4 is "0" volume adjustment in 16 stages may be performed with bits 0 to 3.

When bit 4 is at "1", bits 0 to 3 are ignored and the volume and output systems of the respective channels will vary with the use of an envelope oscillator.

Registers 11 and 12 determine the envelope frequency. Adjustments are performed respectively with 8 bits each.

Register 13 is a place where the system of the envelope waveforms are altered, and as it is comprised of 4 bits the values of 0 to 15 are input.

In order to write in the value to the respective registers or to read out the values of same, they are controlled by signals Ao and A1 which are added to pin 29 (BC1) and pin 27 (BDIR). Register 14 controls I/O port A, and register 15 controls I/O port B.

The combinations of Ao and A1 are as follows:

	(27)	29		
A1	(BDIR)	Ao	(BCI)	
0	(1)	0	(1)	Specifies register.
0	(1)	1	(0)	Writes in value to register.
1	(O)	0	(1)	The contents of the register are
				output to data bus.
1	(O)	1	(0)	Not operated.

The output signals are output to the respective channels from pins 3 , 4 and 38 .

These signals are combined together and amplified with Q26. The output from the address decoder is connected to pin 4 of IC24, and when PSG is selected it becomes "L". In addition, pin 5 is connected to  $\overline{IORQ}$  and when it becomes "L", pin 6 becomes "L".

Therefore, pin 9 of IC52 and pin 11 of IC52 become "L", and operates in the manner stated in the prior clause by Ao and A1 of the address bus,

3-12

# 3-8-1. I/O Port of PSG (IC48)

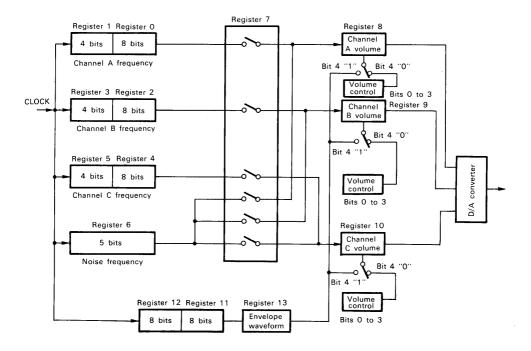

Ther are 2 I/O ports in IC48 and port A is used for input, and port B for output.

These I/O ports may be used as a connector when the joystick is being used.

When the number 7th bit (pin 7) of port B is set at "L", it selects the input from CN8, and when set at "H" it selects the input from CN9. When the pins 1 of IC62 and IC63 are set at "L", the V0 to Y0

When the pins 1 of IC62 and IC63 are set at "L", the V0 to Y0 signals appear at the output, and these signals are added to port A of IC48.

When the pins  $\ 1 \$  of IC62 and IC63 are set at "H", the V1 to Y1 signals are added to IC48.

HB-55P/75P/75B(AE/UK)

# 3-9. VIDEO DISPLAY PROCESSOR (VDP) IC6

The functions of this IC are as follows:

- Resolution of 256×192 bits
- Uses 4K, 8K, and 16K dynamic RAMs.
- Function of automatic refresh of dynamic video RAM • Displays 16 colors including black, white and transparent
- Color difference signal output of PAL system
- Occurence of interruption of each frame is possible.
- · Automatic processing of superimposition of pictures

This IC controls display screens of the family color television and color monitor television. It outputs all video signals, control signals, synchronizing signals, etc., which are based on the PAL system, and performs read/write to VRAM as also refresh.

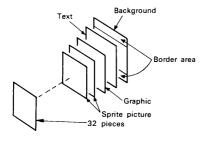

The most distinguished feature of the VDP is the display function of 32 pieces of sprites (graphic pattern of animation pictures). The sprite data registered in the V-RAM are displayed on the sprite surfaces

These are  $8 \times 8$  bits or  $16 \times 16$  bits, and they can be enlarged to twice the sizes of their original sizes

The color specification (1 color of the 16 colors) of the sprite and the display position are also designated on the VRAM. By rewriting this display position coordinates, it can be run at a

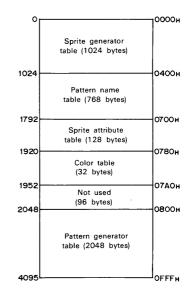

high speed within the picture. In accordance with the priority order (#0 is 1st priority) on the

surface of the sprite, the low order sprite is erased by the high order sprite, and a 3-dimensional depth effect can be obtained.

# 3-9-1. VRAM Mapping

The figure below shows an example of the mapping of the VRAM when the sprite and graphic I mode are used. (When used with the MSX, there are some differences according to the types of software used.

(1) Data area of Graphic I

- 8×8 bits (8 bytes) 1)

  - 3) Color table
  - Maximum 6144 (2048×3) bytes

HB-55P/75P/75B(AE/UK)

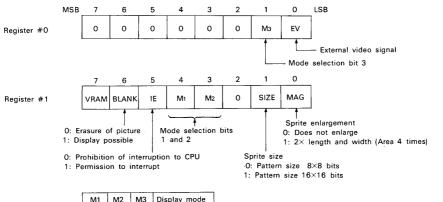

# 3-9-2. VDP Register

In the VDP register, there are a register used exclusively for 8 writing ins and one status register (exclusive to reading out) indicating the state of the VDP.

The picture display is performed by setting data necessary to VDP register, and by writing in picture data to VRAM (dynamic video refresh RAM).

# Setting of respective registers:

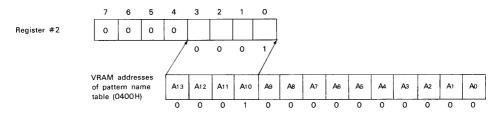

# 1 Register #0 and #1

M1	M2	M3	Display mode
0	0	0	Graphic I
0	0	1	Graphic II
0	1	0	Multi-color
1	0	0	Text

# (2) Register #2

Initial setting of pattern name table

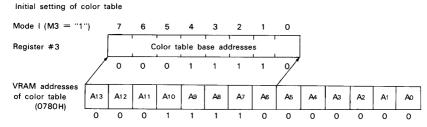

3-16

As the VRAM of VDP is up to 16K bytes (3FFH) only and can be shown with 14 bits, the VRAM addresses become as shown in above figure.

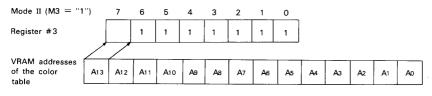

Set the upper 4 bits of the VRAM addresses to the lower 4 bits of Register #2. When the pattern name table starts from address>400 H (1024)10, the content of Register #2 becomes 01.

# 3 Register #3

Set upper 8 bits at the head of the addresses of the VRAM color table to Register #3.

When the color table starts from address>780H (1290)10, the value of register #3 becomes 1E.

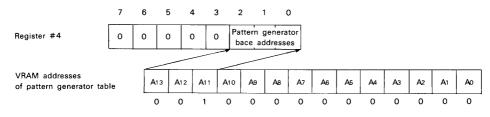

Set the uppermost bit of the head address of VRAM color table to the uppermost bit of Register #3, and set the rest of the 7 bits all to "1".

When color table is above 2000H, Register #3 becomes FFH. When it is below 2000H, it becomes 7FH.

# 4 Register #4

Initial setting of pattern generator table

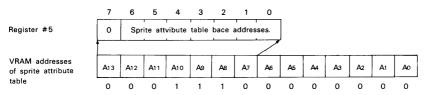

Set upper 3 bits of the head address of VRAM pattern generator table to lower 3 bits of register #4.

When the pattern generator table starts from address> $800_{H}$  (2048)<sub>10</sub>, the value of register #4 becomes>01.

# HB-55P/75P/75B(AE/UK)

# (5) Register #5

Initial setting of sprite attribution table

Set upper 7 bits of the head address of VRAM sprite attribution table to lower 7 bits of register #5. When the sprite attribution table starts from address>700H (1792)10, the value of register #5 becomes>0E.

# (6) Register #6

Sprite generator table

	7	6	5	4	3	2	1	0

Set upper 3 bits of the head address of VRAM sprite generator table to lower 3 bits of register #6. When the sprite generator table starts from address 0, the value of register #6 becomes>00.

# 7 Register #7

Setting of text color/backdrop color

7	6	5	4	3	2	1	0
-	Fext co	olor "1	,, ,,		ext co ackdro		

Performs the specification of colors when the text mode is selected.

The upper 4 bits specify the color of character data "1", the lower 4 bits specify the color of character data "0" and the color of the backdrop. When mode other than text mode is specified, the lower 4 bits

When mode other than text mode is specified, the lower 4 bits become backdrop color specification. The VDP color specification is carried out by 16 kinds of codes; namely, from \$0 to \$F. The correspondence of the respective codes and colors is as follows:

Code	Color	Code	Color
0	Transparent	8	Medium red
1	Black	9	Light red
2	Medium green	A	Dark yellow
3	Light green	В	Light yellow
4	Dark blue	С	Dark green
5	Light blue	D	Magenta
6	Dark red	E	Gray
7	Sky blue	F	White

# 3-18

# 3-9-3. VDP Status Register (for reading out only)

	7	6	5	4		3	2	1	0
ĺ	F	5S	с		No.	5	sprite	numbe	er

1 Interruption flag (F)

When IE (No.5 bit) of register #1 is set at "1", the INT output of VDP becomes active ("L"") when the scanning of the picture has ended.

2 5S and No.5 sprite number When sprites of more than 5 exist in the same horizontal line and the interruption flag (F) is "0", the "55" bit will be set at "1"

In addition, the number of the No.5the sprite surface will be maintained at lower 5 bits.

3 Collision flag (C) When 1 picture element of more than 2 sprites collide (in accord), it is set at "1".

# 3-9-4. Reset of VDP Status Register

The status register is reset in the following cases.

- Input of external reset signal. 1) 2)
- Reading out of status register When the flag is once set, it is continuously set unless the reading out of the next status register is performed.

# 3-9-5. Writing In to the VDP Register

Write in data such as function selection of display mode of the VDP register (for writing in only) and establishment of the respective base addresses The transmission of data from the CPU is carried out in the following way.

						Control signals					
	7	6	5	Bi 4	ts 3	2	1	0	<b>CSW</b>	CSR	MODE
No.1 byte: Data	D7	D6	D5	D4	D3	D2	D1	Do	L	н	н
No.2 byte: Selection of register	1	0	0	0	0	RS0	RS	RSo	L	н	н

Transmit data with No. 1 byte.

The No.2 byte specifies the register of the receiving end of data at lower 3 bits. The uppermost bit should be "1", and the next 4 bits should be "0".

# Control signals

When writing in to VDP the 8 bits data (Do to D7) from the CPU, it becomes active ("L"). The data is set to VDP during the rising time of this

signal. CSR: When it is active ("L"), the VDP outputs the 8 bits (Do

- to D7) to bus line. Set at "L" when transferring data from CPU to VRAM, MODE:
- or when transferring data from VRAM to CPU. In cases other than above, set at "H".

# 3-9-6. Writing In to VRAM

The CPU transfers data to VRAM after going through VDP, with the 14 bit automatic increment address register stored within the VDP.

It is necessary to use 2 bytes in setting up this address register. Figure below shows how to set up this address register and perform data transfer.

								Control signal				
								CSW	CSR	MODE		
No.1 byte: Address set up	A7 A6	A5	A4	Aз	A2	Aı	Ao	L	н	н		
No.2 byte: Address set up	0 1	A13	A12	<b>A</b> 11	A10	A9	A8	L	н	н		
No.3 byte: Data	D7 D6	D5	D4	Dз	D2	Dı	Do	L	н	L		

Set up the lower 8 bits of VRAM address with No.1 byte." Set up upper 6 bits with No.2 bytes.

At this time, the upper 2 bits are (01). Transmit data with No.3 byte.

Once the address register is set up, it is automatically incremented every time the next No.3 byte transfers data. The MODE signal is set at "H" when transferring address, and at "L" when transferring data.

# 3-9-7. Reading Out of Status Register

The CPU performs the reading out with 1 byte the contents of the status register. The respective control signals at this time are as follows:

								Control signals			
	7	6	5	Bi 4	its 3	2	1	0	CSW	CSR	MODE
Status register data	D7	D6	D5	D4	D3	D2	D1	Do	н	L	н

# 3-9-8. Reading Out from the VRAM

The CPU reads out the data from VRAM after going through VDP. Addresses are automatically incremented.

		Con	Control signals		
		CSW	CSR	MODE	
No.1 byte: Address set up	A7 A6 A5 A4 A3 A2 A1 A0	L	н	н	
No.2 byte: Address set up	0 0 A13 A12 A11 A10 A9 A8	L	н	н	
No.3 byte: Data	D7 D6 D5 D4 D3 D2 D1 D0	н	L	L	

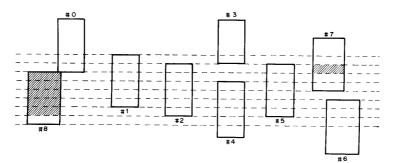

This device employs the I/O ports 98H to 99H for VDP use. The control signals  $\overline{\text{CSW}}$  and  $\overline{\text{CSR}}$  of IC6 (VDP) become active when IORQ and RD or WR become "L" when the address bus

when IORQ and RD are "L", CSR becomes active. When IORQ and RD are "L", CSR becomes active. When IORQ and WR are "L", CSW becomes active. When the address bus signal is 98H, it is accessed to VRAM. When the address bus signal is 99H, it is accessed to VDP register.

# HB-55P/75P/75B(AE/UK)

# 3-9-9. Display Limitation of Sprite

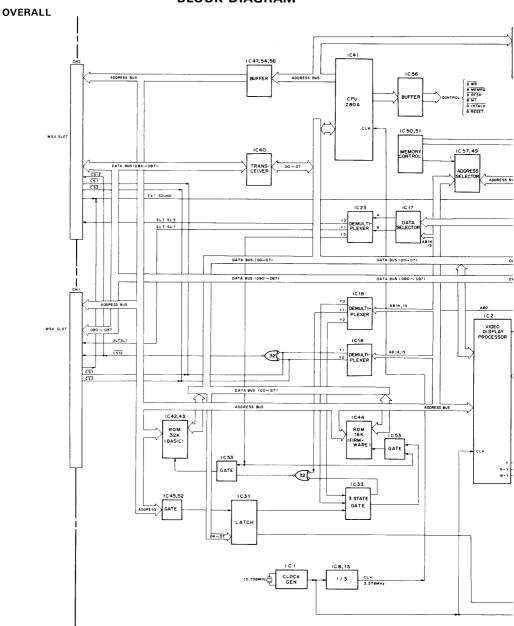

The hatched portion becomes transparent and the background pattern is displayed.

- $\begin{pmatrix} 1 \\ 2 \end{pmatrix}$  The sprites up to 4 can take place on a same horizontal line. (2) When the sprites of more than 5 take place on the same (2) When the spines of more than 5 take place on the same horizontal line, 4 sprites that have high priority (in the order of #0, #1 ..... #32) are displayed and the sprite from 5 and above are not displayed.
   (3) The state of the sprites can be ascertained by referring to the status register.

HB-75P/75B(AE/UK)

# CHAPTER 6 ALIGNMENT

# 6-1. HB-55P/75P/75B ADJUSTMENT

Note: Adjustment should be performed in the order mentioned below.

## 6-1-1. VCO Phase Adjustment

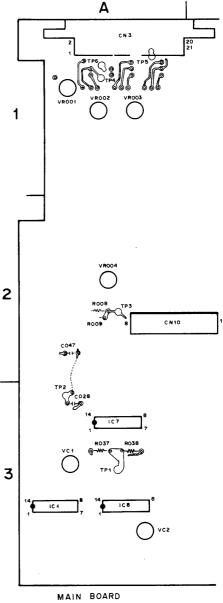

Equipment Required	:t	Digital Volt Meter
Check Point	:	TP1 (Junction Point of R37 and R38)/
		MAIN
Specification	:	$7.0V \pm 0.1V$
Adjustment	:	VC1/MAIN

# 6-1-2. SUB Carrier Frequency Adjustment

Equipment Required	FREQUENCY COUNTER
Check Point	: TP2 (Junction Point of C28 and C47)/
	MAIN
Specification	: 4.433618 MHz $\pm$ 10 Hz
Adjustment	VC2/MAIN

#### 6-1-3. Video Output Level Adjustment

Equipment Required: Condition	<ul> <li>OSCILLOSCOPE</li> <li>1 Terminated pin 2 of CN1 (AUDIO/ VIDEO OUTPUT)/POWER between GND with 75Ω, or connect the Monitor TV (75Ω INPUT) to CN1/ POWER. But, do not connect to CN3 (RGB OUTPUT)/MAIN.</li> <li>2 Example BASIC will have the list programmed and run.</li> <li>10 COLOR 15, 15 20 END</li> </ul>
	TP3 (pin 2 of CN1)/POWER
Specification	$A = 1V \pm 0.1 Vp-p$
	A Sync level
Adjustment	: VR4/MAIN

- COMPONENT SIDE-

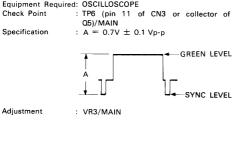

HB-55P/75P/75B(AE/UK)

### 6-2. HB-75P/75B RGB ADJUSTMENT

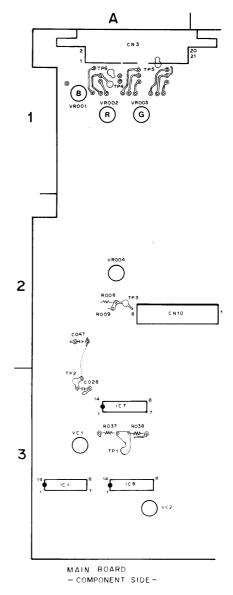

- Note 1: After adjusting step 6-1, the following adjustment should be performed. Note 2: Adjustment should be performed by terminating each
- Note 2: Adjustment should be performed by terminating each test point between GND with 75Ω or , connect the Monitor TV (75Ω INPUT) to CN3 (RGB OUTPUT)/MAIN. But do not connect to CN1 (AUDIO/VIDEO OUTPUT)/ POWER.
- Note 3: Example BASIC will have the list programmed and run 10 COLOR \_ 15, 15 20 END

#### 6-2-1. Blue Output Level Adjustment

Equipment Required: OSCILLOSCOPE : TP4 (pin 3 of CN3 or collector of Q1)/MAIN Check Point Specification  $A = 0.7V \pm 0.1 Vp-p$ BLUE LEVEL SYNC LEVEL Adjustment : VR1/MAIN 6-2-2. Red Output Level Adjustment Equipment Required: OSCILLOSCOPE : TP5 (pin 15 of CN3 or collector of C3)/MAIN : A = 0.7V  $\pm$  0.1 Vp-p Check Point Specification RED LEVEL SYNC LEVEL Adjustment : VR2/MAIN 6-2-3. Green Output Level Adjustment Equipment Required: OSCILLOSCOPE

6-2

#### NOTE:

 The shaded and A -marked components are critical to safety. Replace only with same components as specified.

 Parts printed in Bold-Face type are normally stocked for replacement purposes. The remaining parts shown in this manual are not normally required for routine service work. Orders for parts not shown in Bold-Face type will be processed, but allow for additional delivery time.

 Item with no part number and/or no description are not stocked because they are seldom required for routine service.

NOTE:

 The shaded and A -marked components are critical to safety. Replace only with same components as specified.

 Item with no part number and/or no description are not stocked because they are seldom required for routine service.

Parts printed in Bold-Face type are normally stocked for replacement purposes. The remaining parts shown in this manual are not normally required for routine service work. Orders for parts not shown in Bold-Face type will be processed, but allow for additional delivery time.
